Project Name: TalentFlow

Version:

1. Project Overview

- **Problem Statement:** The recruitment process for candidates rely on a very fragmented, unstructured and manual workflow. A team of human resources must gather candidate information, verify various documentations, track candidate onboarding through spreadsheets or cluttered email logs. This forms an inefficient structure prone to human error. Simultaneously, candidates are required to constantly keep track of their resume applications across multiple platforms.
- **Target Domain:** The recruitment department and candidates applying on a centralised platform.
- **Proposed Solution Summary:** TalentFlow serves as a structured recruitment and onboarding management platform that streamlines the process of receiving candidate intake and live monitoring. The system allows for HR to view candidate submissions and track onboarding in real time through activity monitors, while candidates can submit their applications easily through structured digital forms.

  Z. AI is additionally incorporated as a centralised processing engine in verifying the validity of candidate applications, organising candidate submissions and updating activity monitors live for HR team viewing.

2. Background & Business Objective

- **Background of the Problem:** Traditional recruitment processes rely on manual documentations of applicant information through spreadsheets or emails. Additionally, HR must be tracking candidate applications for verifying the validity of the application in preparations for onboarding. This process is not only old-fashionedly out of date without a centralised platform but delays onboarding with the sheer volume of candidate applications.

- **Importance of Solving This Issue:** Streamline the recruitment process through logging onboarding activities in the system. Simultaneously, provide a monitoring system for organising candidate applications whilst verifying the inclusion of all

required documents when applying. It becomes a surefire way of increasing the efficiency rate of company hiring.

- **Strategic Fit / Impact:** TalentFlow aligns itself with various Sustainable Development Goals (SDG) such as SDG 8 (Decent Work and Economic Growth) by helping companies automate their onboarding process and SDG 9 (Industry, Innovation and Infrastructure) through introducing a digital infrastructure to be integrated into a modernised future.

3. Product Purpose

3.1. Main Goal of the System: Streamline the onboarding and recruitment workflow in a simplified manner that provides organisations with a monitoring system for candidate activities and progress.

3.2. Intended Users (Target Audience):

- Managers
- Recruitment Teams / HR
- Job Candidates

4. System Functionalities

4.1. Description:

TalentFlow is a centralized platform to manage candidate applications submitted and monitor onboarding progress. Candidates submit their applications through a digital form, whilst the system documents their submissions to be categorised into the database. It incorporates an integrated Z AI to parse candidate resumes and organise activity logs.

4.2. Key Functionalities:

- **Candidate Application Form:** Digital form with required fields with AI parsing of submitted resumes.
- **Application Monitoring Dashboard:** Dashboard displaying all candidate applications according to organised categories with employer and AI feedback.
- **AI Activity Logs:** Isolated page displaying AI activities (document parsing, candidate status and scheduling interviews) in viewable monitoring logs.

- **Status Tracking:** Updates status of submitted applications for candidate viewing in real time.

4.3. AI Model & Prompt Design

4.3.1. Model Selection: TalentFlow uses the Z AI GLM for integrating a monitoring system alongside summary generating. This model was chosen due to being useful for processing natural language efficiently while generating quick structured responses for proper workflow.

4.3.2. **Prompting Strategy:** The team uses a zero-shot prompting strategy, in which the model receives activity log data to provide readable summaries. Since rather than complicated prompting, the system deals with consistent data input without extensive prompting.

4.3.3. **Context & Input Handling**: TalentFlow receives structurally sized information from the candidate application forms. The platform limits the length of user input within the submission forms, prompting users to revise their submissions if inputs become cluttered.

4.3.4. **Fallback & Failure Behavior:** TalentFlow has implemented fallback systems upon unusable responses from the AI model. The AI response is discarded upon validation failure, followed by the system retrying the request. If either fails, the raw activity logs are to be displayed instead.

5. User Stories & Use Cases

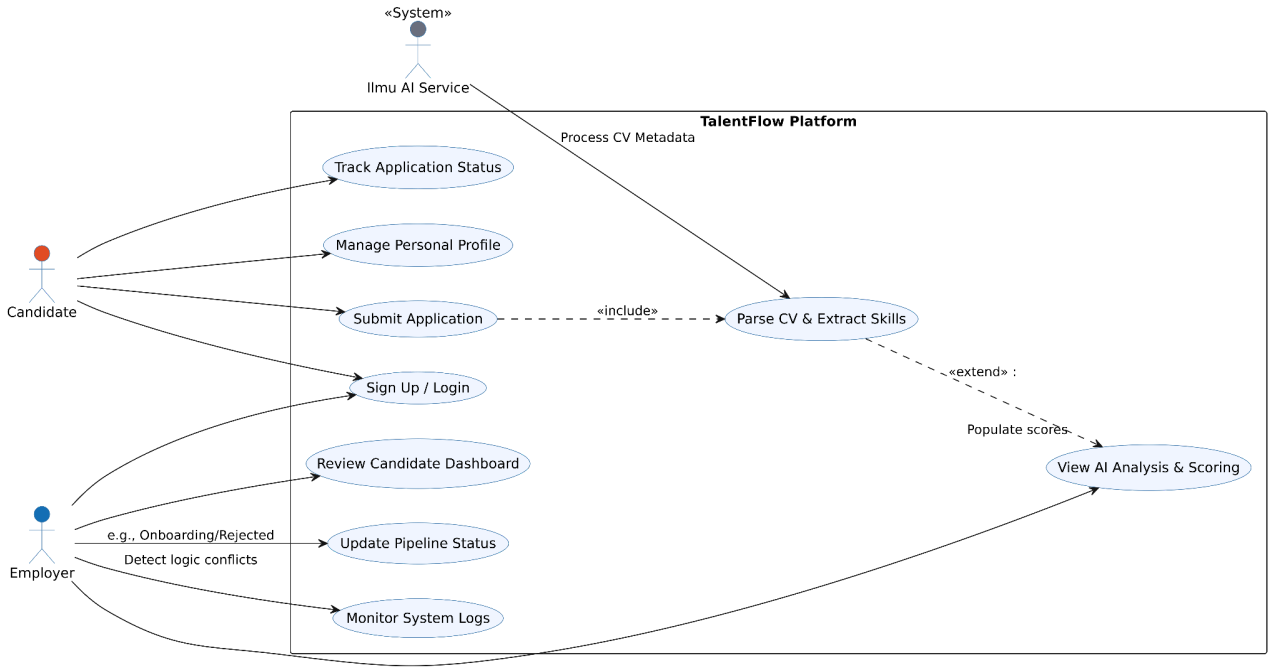
- **User Stories:**
  As a candidate, I want to submit my application for a company position by filling out the digital form.
  As an employer, I want to monitor all candidate applications submitted to keep track of onboarding progress.

- **Use Cases (Main Interactions):**

  Candidate Application: User uploads resume to the digital form, and fills up the form with required candidate information which is stored in the database.

Application Monitoring: Employer accesses monitoring dashboard to see categorised statistics on the onboarding

- **Use Case Diagram:**



6. Features Included (Scope Definition)

- Digital applicant form for submission with AI parsing
- Submission monitor for candidates with provided feedback from employer and AI
- Live dashboard to monitor candidate applications in the system
- Activity monitor that tracks AI activity
- Highlighting edge cases that involve missing documents or ambiguity
- Separate workspaces with navigation bars
- Login system for both available user roles (employee & employer)
- Toggle mode (light/dark)

7. Features Not Included (Scope Control)

- Predictive hiring analytics
- AI recommendation system based on the candidate CV information
- Push notifications for AI activities that demand alert
- No mobile implementation

- Multi-language support

8. Assumptions & Constraints

- **LLM Cost Constraint:** The team's AI token cost is lightweight due to it primarily used for monitoring candidate application. The system limits the overall token usage through concise activity logs rather than complete datasets.

- **Technical Constraints:** TalentFlow is developed as a web-based application with HTML, CSS and JavaScript interfaces for simplistic prototyping.

- **Performance Constraints:** AI processing limits for system events to ensure user interface responsiveness. As the amount of candidates' application increases, the system may require additional optimization.

- **User Input:** TalentFlow involves candidate information from their applications. The form having AI parsing implemented still may require candidates to input required information that is missed out.

9. Risks & Questions Throughout Development

- **Workflow Dependency:** What happens if one stage of the onboarding process fails?
- **AI Log Clarification:** What if the AI logs the onboarding categories incorrectly?
- **System Scalability:** Can the system handle large volumes of candidate intakes?
- **Security Safety:** How to keep unauthorized users from viewing sensitive candidate data?
